SURFACE ANALYSIS

The map displays a complex weather pattern over East Asia. A low-pressure system is centered over the Korean Peninsula, with a cold front extending northwestward and a warm front extending southeastward. Another low-pressure system is located further east, near Japan, with associated cloud bands. High-pressure areas are situated to the north and south of the main storm systems. Wind directions and speeds are indicated by arrows and numbers throughout the map. Cloud cover is represented by various symbols and percentages. Precipitation is shown with specific codes. Notable labels include "FOG [W]" indicating fog over water, "ALMOST STRR" for almost steady rain, and several numerical values representing pressure and other meteorological parameters.
